Add server

Docker MinIO module **WHMCS**

Order now | Download | FAQ | n8n

Add a new server to the system WHMCS

Navigate to: **System Settings → Servers → Add New Server**

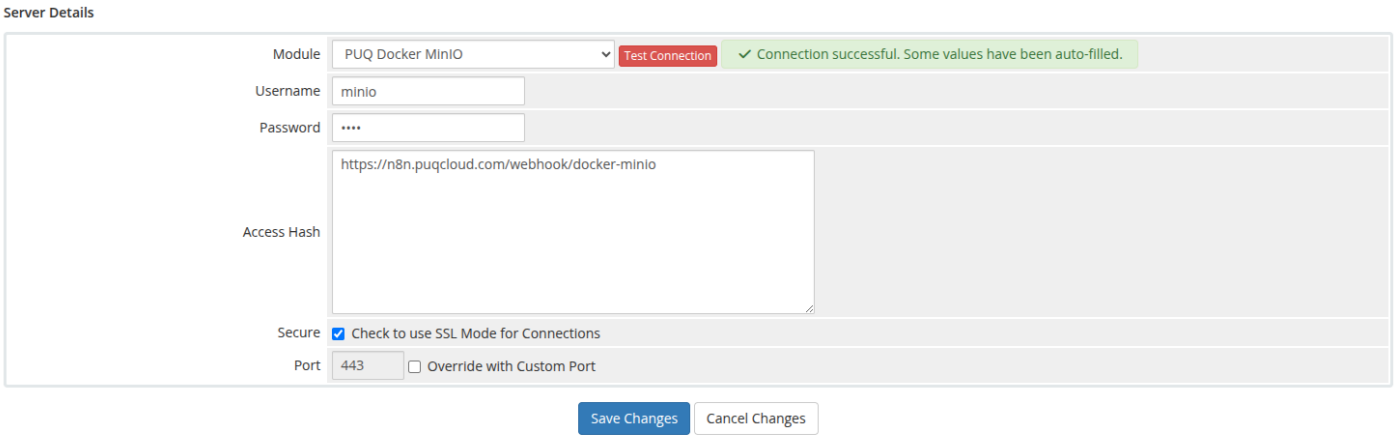

- Enter the correct **Name** and **Hostname**

> **Attention: Important Information** The **hostname** field represents the actual domain of the server running Docker and must match the **server_domain** parameter in the **n8n workflow**. If they do not match, communication will not function correctly. Additionally, this domain must be configured so that all its subdomains resolve to the IP address of the server running Docker.

Module settings

In the **Server Details** section, select the **"PUQ Docker MinIO"** module and enter the correct **username** and **password** for the **API endpoint** in the n8n workflow.

> Additionally, in the **Access Hash** field, insert the **URL of the API entry point** for the n8n workflow.
