

# Add server

## Docker NextCloud module WHMCS

[Order now](#) | [Download](#) | [FAQ](#) | [n8n](#)

Add a new server to the WHMCS system.

System Settings->Servers->Add New Server

- Enter the correct **Name** and **Hostname** for your server.

|   |  |
|---|--|
| Name                                    | <input type="text" value="d01-test.uuq.pl"/>   |
| Hostname                                | <input type="text" value="d01-test.uuq.pl"/>   |
| IP Address                              | <input type="text"/>   |
| Assigned IP Addresses<br>(One per line) | <div></div>  |
| Monthly Cost                            | <input type="text" value="0.00"/>  |
| Datacenter/NOC                          | <input type="text"/>   |
| Maximum No. of<br>Accounts              | <input type="text" value="200"/>   |
| Server Status Address                   | <div><input type="text"/><br/>To display this server on the server status page, enter the full path to the server status folder (required to be uploaded to each server you want to monitor) - eg.<br/>https://www.example.com/status/</div> |
| Enable/Disable                          | <input type="checkbox"/> Check to disable this server  |

Attention: Important Information

The **hostname** field must precisely match the domain configured as **server\_domain** in the **n8n workflow**. Misalignment between these parameters will disrupt the communication between WHMCS and Docker. Furthermore, ensure this domain is configured so that all subdomains point correctly to the Docker server's IP address.

The screenshot shows a configuration window titled "Parametrs" with a "Test step" button. It has tabs for "Parameters" (selected), "Settings", and "Docs". Under "Parameters", the "Mode" is set to "Manual Mapping". The "Fields to Set" section contains two entries:

| Field Name    | Type   | Value               |
|---------------|--------|---------------------|
| server_domain | String | d01-test.uuq.pl     |
| clients_dir   | String | /opt/docker/clients |

In the **Server Details** section, choose the module "**PUQ Docker NextCloud**". Enter the accurate **username** and **password** as configured for the **API endpoint** in the n8n workflow.

Additionally, input the **URL of the API entry point** from the n8n workflow into the **Access Hash** field.

Server Details

|             |   |
|-------------|---|
| Module      | <div>PUQ Docker NextCloud</div> <div>Test Connection</div> <div>✓ Connection successful. Some values have been auto-filled.</div> |
| Username    | <div>nextcloud</div>  |
| Password    | <div>●●●●●●●●●●●●●●●●</div> <div>👁</div>  |
| Access Hash | <div>https://n8n.puqcloud.com/webhook/docker-nextcloud</div>  |
| Secure      | <div><input checked="" type="checkbox"/> Check to use SSL Mode for Connections</div>  |
