# How to Update or Refresh a Module

## PUQcloud Panel

Order Now | Download | FAQ

---

## Overview

The **Refresh (Update)** button allows you to safely upgrade or downgrade a module version.
This function ensures all database tables and settings are synchronized with the new configuration file.

---

## When to Use Refresh

- When the module's version number in the configuration file changes.
- When the module stops appearing in the list after updating its files.
- When switching to an older version (downgrade).

---

## Steps to Update a Module

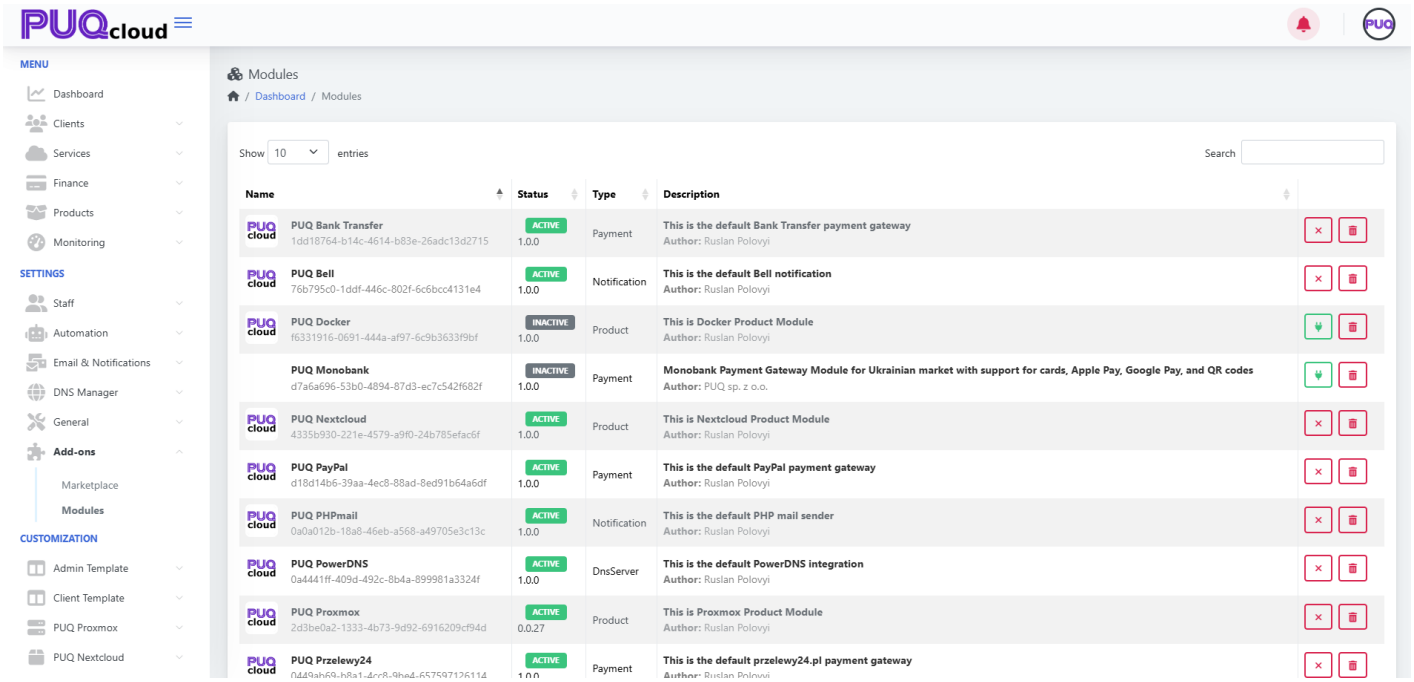

1. Replace the module files with the new (or old) version.
2. Go to **Dashboard → Modules**.
3. Click the **blue Refresh ( )** button next to the affected module.
4. The system runs the `Update` function, which:
   - Compares installed and config versions.
   - Updates database structure and settings.
   - Re-registers the module in the system.

---

## Result

The module becomes visible and active again under the correct version.
This process ensures safe, **controlled updates** without breaking dependencies.
