

How to Update or Refresh a Module

PUQcloud Panel

[Order Now](#) | [Download](#) | [FAQ](#)

Overview

The **Refresh (Update)** button allows you to safely upgrade or downgrade a module version. This function ensures all database tables and settings are synchronized with the new configuration file.

When to Use Refresh

- When the module's version number in the configuration file changes.
 - When the module stops appearing in the list after updating its files.
 - When switching to an older version (downgrade).
-

Steps to Update a Module

1. Replace the module files with the new (or old) version.
 2. Go to **Dashboard → Modules**.
 3. Click the **blue Refresh ()** button next to the affected module.
 4. The system runs the `Update` function, which:
 - Compares installed and config versions.
 - Updates database structure and settings.
 - Re-registers the module in the system.
-

Result

The module becomes visible and active again under the correct version. This process ensures safe, **controlled updates** without breaking dependencies.
