Add a Jellyfin server in WHMCS

Jellyfin module **WHMCS**

Order now | Download | Community

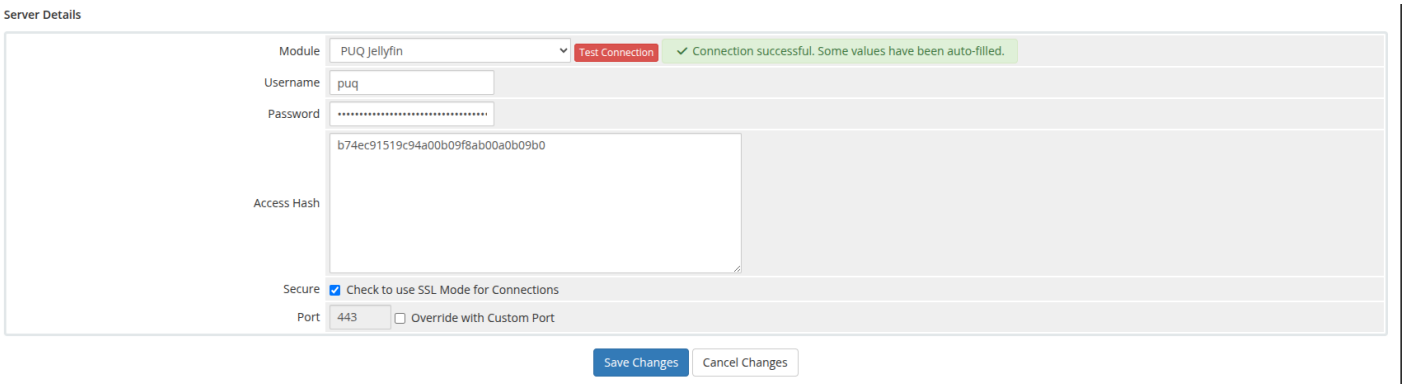

Configure the connection to your Jellyfin server under **Setup → Products/Services → Servers → Add New Server**.

Field	Value
Hostname / IP Address	The Jellyfin server hostname or IP.
Secure (SSL)	Enable if Jellyfin is served over HTTPS.
Port	Jellyfin port (default `8096`, or `443` when SSL is enabled).
Username	A Jellyfin **administrator** username.
Password	That administrator's password.

Field	Value
Access Hash	A Jellyfin **API key** (Dashboard → API Keys).
Type / Module	`PUQ Jellyfin`.

In the **Server Details** section select **Module → PUQ Jellyfin** and fill in the **Username**, **Password** and **Access Hash** (API key), tick **Secure** for SSL and set the **Port**.

Use **Test Connection** to confirm WHMCS can reach Jellyfin and authenticate. The module authenticates with the username/password + API key to obtain an access token, then calls `System/Info` to verify connectivity.

Assign the server (or a server group containing it) to your Jellyfin product under the product's **Module Settings**.
