Add server (ownCloud server)

ownCloud module **WHMCS**

Order now | Download | Community

Adding an ownCloud server to WHMCS

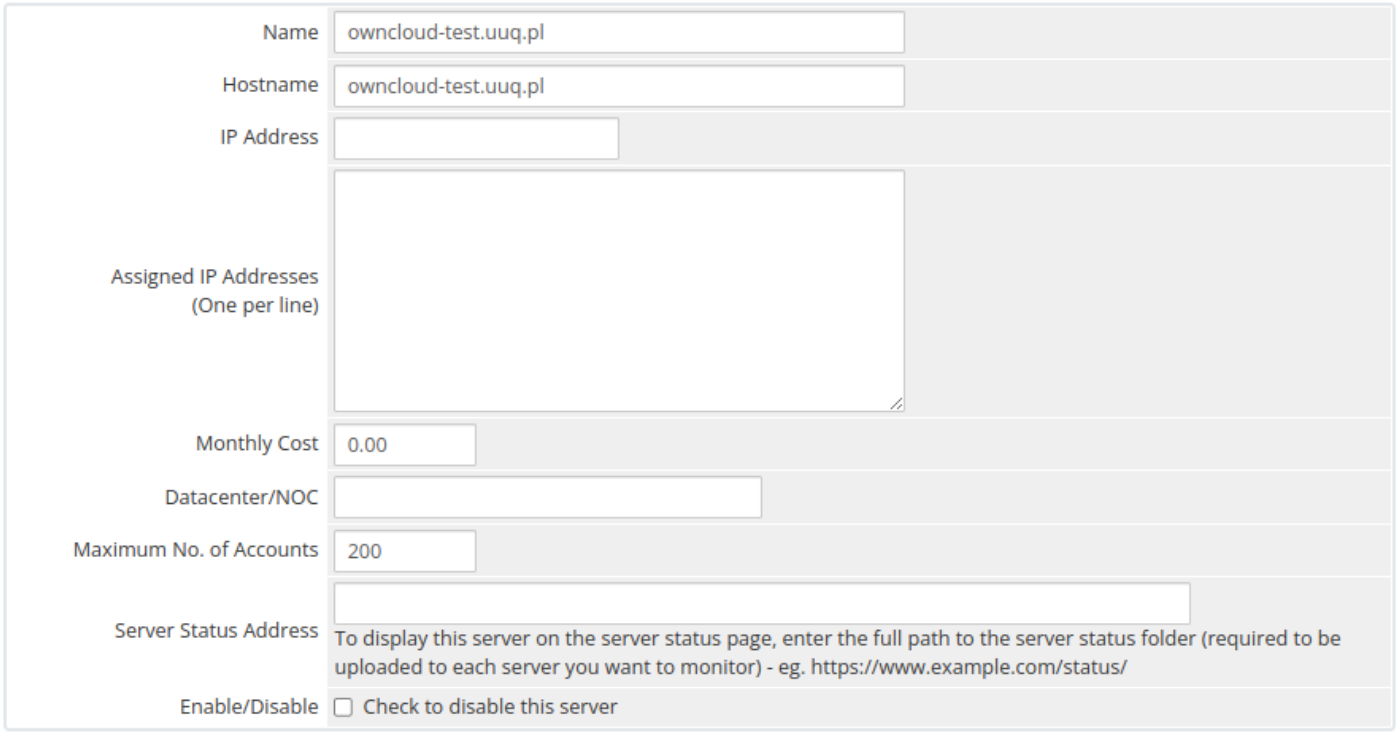

Navigate to **System Settings** → **Servers** → **Add New Server**

Step 1: General settings

Enter the correct **Name** and **Hostname** for your ownCloud server.

- **Name** — a descriptive name for the server (e.g. "ownCloud Production")
- **Hostname** — the domain name or IP address of your ownCloud installation (e.g. `cloud.example.com`)

If your ownCloud uses a non-standard port, enter it in the **Port** field. Check the **Secure** checkbox if your server uses HTTPS (recommended).

Step 2: Module settings

1. In the Server Details section, select the **PUQ ownCloud** module from the dropdown
2. Enter valid credentials for the ownCloud web interface:
   - **Username** — ownCloud administrator username
   - **Password** — ownCloud administrator password
3. Click **Test connection** to verify the connection is working correctly

The test connection verifies that the module can reach the ownCloud OCS API (`/ocs/v1.php/cloud/users/`) and authenticate with the provided credentials.

05-add-server-2.png

> **Important:** The ownCloud user must have **administrator privileges** to manage users via the API. The module uses the ownCloud OCS API v1 with HTTP Basic Authentication to create, modify, suspend, and delete user accounts.
