

# revDNS configuration

## ProxmoxKVM module **WHMCS**

[Order now](#) | [Download](#) | [FAQ](#)

On the configuration page of the reverse DNS zone, the client has the opportunity to set the domain name for the IP address of his virtual machine.

Currently, the module does not support the automatic update of revDNS, but supports the creation of requests with a request to update this setting by a specialist responsible for it in the company. You can set this option '**Revdns ticket/RevDNS ticket department**' during product configuration.

### Reverse DNS record

**i** Changing a DNS record does not happen instantly. For a DNS record to work properly, it takes between 1 and 8 hours for the DNS servers to synchronize the record
