Session Logs:

The section lists all administrative sessions, including details such as:

Date:

The exact date and time when the session occurred.

Admin:

The name or identifier of the administrator who initiated the session.

IP Address:

The IP address from which the administrator accessed the system.

URL:

The specific URL accessed by the administrator during the session, categorized as either **API** or **WEB**.

Filtering Options:

Date Range:

Allows filtering sessions based on a specified date and time range.

Hide Me:

A toggle option to exclude the current administrator's sessions from the view for better focus on other administrators.

Real-Time Updates:

The section can be set to auto-refresh at intervals such as 5 seconds, ensuring administrators see the latest activity logs in real-time.

Pagination:

Supports navigation through a large number of logs, with options to select the number of entries displayed per page.

Details Logged:

The following details are captured for each session:

- Type:** Categorized as API calls or WEB-based interactions.
- HTTP Method:** Specifies whether the action was a **GET**, **POST**, or another HTTP method.
- Session Activity:** Tracks specific actions taken by the administrator within the system,

such as accessing logs, modifying settings, or interacting with modules.

Usage:

The **Admin Sessions** section is essential for tracking administrative activities, troubleshooting issues, and maintaining the integrity of the system. By providing a detailed overview of all sessions, administrators can monitor unauthorized access attempts, audit system usage, and ensure compliance with internal policies.
