

Monitoring: Module Log Overview

PUQcloud Panel

[Order Now](#) | [Download](#) | [FAQ](#)

The **Module Log** section in the PUQ Cloud Panel provides administrators with a detailed log of all activities related to the modules integrated within the system. This section is crucial for diagnosing issues, auditing changes, and monitoring the performance of various modules.

Key Features:

- **Log Entries:** Displays all recorded module activities, including actions, timestamps, and statuses. Each entry helps trace the execution of module-specific tasks.
- **Filters:** Administrators can apply date and time filters to focus on specific periods, making it easier to pinpoint relevant logs.
- **Details:** Each log entry includes the following fields:
 - **Date:** The exact time when the action occurred.
 - **Name:** Identifies the module associated with the log entry.
 - **Action:** Describes the operation performed, such as installation, update, or removal.
 - **Level:** Indicates the severity or status of the action, such as INFO, WARNING, or ERROR.
- **Real-Time Updates:** The module log can be configured to auto-refresh at specified intervals, ensuring administrators see updates as they occur.
- **Search Functionality:** Allows administrators to quickly find specific entries using keywords or module names.

Usage:

The **Module Log** is designed to streamline the monitoring and troubleshooting process for administrators. By providing a comprehensive view of module-related actions, it helps ensure system stability and efficient module management.

Example Use Cases:

- **Issue Diagnosis:** Identify errors or warnings generated by modules to quickly resolve technical problems.

- **Performance Monitoring:** Track the execution of scheduled tasks or updates performed by modules.
 - **Change Auditing:** Review logs to confirm recent module installations or configuration changes.
