# Basic concepts IKEv2 EAP

[Order now](#) | [Download](#) | [FAQ](#)

Since version 1.2 **PUQVPNCP** supports VPN protocol **IKEv2** implemented with [strongSwan](#)

**IKEv2** is a protocol that allows you to create direct IPsec tunnels between a server and a client. **IPsec** provides encryption of network traffic in IKEv2 virtual private networks. **IKEv2** is natively supported on a number of platforms (OS X 10.11+, iOS 9.1+, Windows 10) without additional applications and easily resolves client connectivity issues.

For the protocol to work correctly, it is necessary to configure certificates for encryption; using the panel, this process is easy and comes down to pressing literally two buttons.

It is worth remembering that the main VPN protocol in the panel is WireGuard, and the **IKEv2** protocol is an additional protocol. This means that before using **IKEv2**, you must configure the WireGuard protocol, and then enable **IKEv2** support on each **WireGuard** interface on which you want to use **IKEv2**.

## IKEv2 protocol available to clients

- **Android** (Official application from strongSwan)
- **iOS** (integrated client)
- **macOS** (integrated client)
- **Linux** (network-manager-strongswan)
- **Windows** (integrated client)

Due to the specifics of Microsoft's implementation of the client in Windows, there is a technical nuance that requires you to enter the password twice each time you connect.

## Usage features IKEv2 EAP

- To use the **IKEv2 EAP** protocol, the client must have the domain name of the VPN server, username and password for authorization, and there is a need to import the root

certificate to authenticate the server certificate.

- The **IKEv2 EAP** protocol uses **IPSec** encryption to encrypt traffic between the client and the server, this imposes a certain load on the server and we recommend taking this into account when choosing server parameters.
- The data transfer rate in the case of rate limiting is lower than declared, due to the fact that all data packets are consistent with the headers that are required for IPSec encryption to work. *This is especially noticeable at low limits of 1-10 megabits.*
- Due to the technical aspects of VPN client rate limiting, the data rate limit will be taken from the outgoing traffic parameter, this parameter in **IKEv2** connections will be for incoming and outgoing traffic

# Technical requirements and installation

[Order now](#) | [Download](#) | [FAQ](#)

## Technical requirements

- Operating systems: Debian 9+ (amd64), Ubuntu 18+ (amd64)
- Real ip address on server interface
- Domain name for the server
- **PUQVPNCP v1.2**
- Installed packages **strongswan strongswan-pki libstrongswan-extra-plugins**

## Installation

We issue all commands after logging into the SSH terminal window as the root user.

```
apt-get update  
apt-get upgrade  
reboot
```

```
apt-get install strongswan strongswan-pki libstrongswan-extra-plugins -y
```

## Checking installed packages

### Checking the strongSwan

```
dpkg -s strongswan-starter
```

Output should look similar to this:

```
Package: strongswan-starter
Status: install ok installed
Priority: optional
Section: net
Installed-Size: 610
Maintainer: strongSwan Maintainers <pkg-swan-devel@lists.alioth.debian.org>
Architecture: amd64
Source: strongswan
Version: 5.9.1-1+deb11u3
Depends: adduser, libstrongswan (= 5.9.1-1+deb11u3), lsb-base (>= 3.0-6), debconf (>= 0.5) |
debconf-2.0, libc6 (>= 2.27)
Pre-Depends: init-system-helpers (>= 1.54~)
Recommends: strongswan-charon
Conflicts: openswan
Conffiles:
 /etc/apparmor.d/usr.lib.ipsec.stroke 3ddc2d056db9435ba0d421678308bee3
 /etc/init.d/ipsec a7b2d9de5749ee0bebcd6ac3f9fee732
 /etc/ipsec.conf 01485a8658db82dd781f9229f4151661
 /etc/ipsec.secrets d8e074734da10d2ec7bcd9913263d717
 /etc/strongswan.d/charon/stroke.conf effb1b5bc46a7c849754fada75bae0d2
 /etc/strongswan.d/starter.conf 2ba2784c18e268e34cec179d90e38437
Description: strongSwan daemon starter and configuration file parser
 The strongSwan VPN suite uses the native IPsec stack in the standard
 Linux kernel. It supports both the IKEv1 and IKEv2 protocols.
 .
 The starter and the associated "ipsec" script control the charon daemon from
 the command line. It parses ipsec.conf and loads the configurations to the
 daemon.
Homepage: http://www.strongswan.org
```

---

## Checking the IPsec Version

```
ipsec version
```

Output should look similar to this:

```
Linux strongSwan U5.9.1/K5.10.0-10-amd64
University of Applied Sciences Rapperswil, Switzerland
```

See 'ipsec --copyright' for copyright information.

## Checking the pki

pki

Output should look similar to this:

```
strongSwan 5.9.1 PKI tool
loaded plugins: test-vectors pkcs11 tpm aes rc2 sha2 sha1 md5 mgf1 random x509 revocation
pubkey pkcs1 pkcs7 pkcs8 pkcs12 dnskey sshkey pem openssl gcrypt af-alg gmp curve25519 hmac
drbg curl
usage:
  pki --acert (-z) issue an attribute certificate
  pki --dn (-d) extract the subject DN of an X.509 certificate
  pki --gen (-g) generate a new private key
  pki --issue (-i) issue a certificate using a CA certificate and key
  pki --keyid (-k) calculate key identifiers of a key/certificate
  pki --pkcs12 (-u) PKCS#12 functions
  pki --pkcs7 (-7) PKCS#7 wrap/unwrap functions
  pki --print (-a) print a credential in a human readable form
  pki --pub (-p) extract the public key from a private key/certificate
  pki --req (-r) create a PKCS#10 certificate request
  pki --self (-s) create a self signed certificate
  pki --signcrl (-c) issue a CRL using a CA certificate and key
  pki --verify (-v) verify a certificate using the CA certificate
  pki --help (-h) show usage information
```

# Create a root certificate

# Import the root certificate

[Order now](#) | [Download](#) | [FAQ](#)

If you don't have a root certificate ready, use the certificate generation option. More in the certificate generation instruction section.

Go to menu item **VPN servers -> IKEv2**

The screenshot shows the 'IKEv2' configuration page in the PUQVPNCP interface. The sidebar on the left includes 'Dashboard', 'VPN servers', 'WireGuard', 'IKEv2', 'VPN accounts', 'Settings', and 'About us'. The main content area is titled 'IKEv2' and features a 'Save' button and an 'Advanced settings' link. The configuration includes: 'IKEv2 Enabled' (NO), 'Start key' (not running), 'Charon' (not running), 'ROOT certificate' (Certificate not found), 'Common name\*' (TEST\_CN), 'Organization\*' (TEST\_OU), 'Organizational Unit' (TEST\_OU), 'Locality' (TEST\_L), 'State or Province Name' (TEST\_S), 'Country Name' (TEST\_C), 'SERVER certificate' (Certificate not found), 'Server Domain\*' (dev.softkeel.com), and 'Server IP\*' (77.87.125.200). A 'Generate ROOT certificate' button is highlighted. The 'CaCert' and 'CaKey' sections show 'Certificate not found' and an 'Import ROOT certificate and key' button. The 'SERVER certificate info' section also shows 'Certificate not found'.

You need to fill in the fields intended for the root certificate and for the private key

- **CaCert**
- **CaKey**

To import the root certificate and private key, click the **Import ROOT certificate and key** button

After these steps, the **root certificate and private key** will be imported.

Information about the certificate will be available there.

# Create a server certificate

[Order now](#) | [Download](#) | [FAQ](#)

Before creating a server certificate, you must create or import a root certificate.

Go to menu item **VPN servers -> IKEv2**

The screenshot shows the PUQVPNCP web interface. The top navigation bar includes the logo 'PUQVPNCP', a help link '? HELP?', a user profile 'ruslan (79.184.3.204)', and a 'Logout' button. The left sidebar contains a 'Dashboard' menu and a 'VPN servers' section with sub-items 'WireGuard' and 'IKEv2' (highlighted). Below this are 'VPN accounts', 'Settings', and 'About us'. The main content area is titled 'IKEv2' and features a 'Save' button and an 'Advanced settings' link. The configuration is divided into several sections: 'IKEv2 Enabled' (set to 'NO'), 'Starter: not running', and 'Charon: not running'. The 'ROOT certificate' section shows a 'certificate trusted, lifetimes valid' status with 'Delete ROOT certificate' and 'Download CA certificate'/'Download CA key' buttons. The 'SERVER certificate' section shows a 'Certificate failed' status with a 'Generate SERVER certificate' button. A detailed view of the ROOT certificate information is displayed, including fields like subject, issuer, validity, serial, flags, subjkeyId, pubkey, keyid, and subjkey.

You need to fill in the required fields such as:

- **Server Domain**
- **Server IP**
- **Common name**
- **Organization**

Then click the button **Generate SERVER certificate**

After these steps, the **Server certificate and private key** will be generated. Information about the certificate will be available in the same place.
