

DNS settings

[Order now](#) | [Download](#) | [FAQ](#)

This step is required for the solution to work properly.

Once DNS is properly installed, you need to enable it.

DNS configuration is available in the menu item **Settings->DNS**

The screenshot shows the PUQVPNCP web interface. The top navigation bar includes the logo 'PUQVPNCP', a '? HELP ?' button, a user profile 'ruslan (79.184.10.59)', and a 'Logout' button. The left sidebar contains a menu with 'Dashboard', 'VPN servers', 'VPN accounts', 'Settings', and 'About us'. The 'Settings' section is expanded, showing 'Firewall', 'DNS' (highlighted with a red box), 'One-time link', 'System users', 'API', and 'License'. The main content area is titled 'DNS' and features a 'Save' button. Below the button, there are several configuration fields: 'Enabled' (a dropdown menu set to 'YES'), 'Running: PID: 3238890' (displayed in green), 'Forwarder DNS1' (input field with '1.1.1.1'), 'Forwarder DNS2' (input field with '8.8.8.8'), and 'Max cache ttl' (input field with '300').

The DNS server is configured as a caching DNS server for VPN clients.

Attention. The use of the DNS server is possible only by the clients of the system. The system automatically configures the DNS server so that only those subnets that are configured in the system have access.
