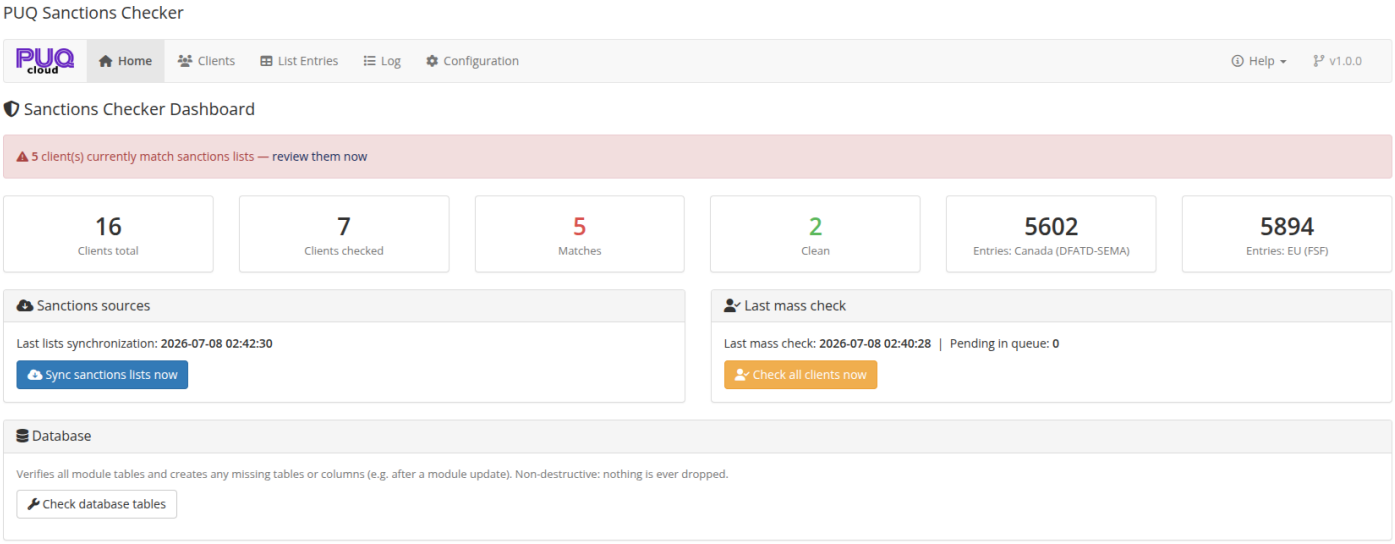
PUQ Sanctions Checker module **WHMCS**

Order now | Download | Community

Addons → Sanctions Checker → Home — the operational overview of the module.



Statistics cards

Card	Meaning
Clients total	All clients in WHMCS.
Clients checked	Clients that have at least one screening result.
Matches	Clients currently matching sanctions lists — the red alert on top links straight to the filtered list.
Clean	Clients checked with no findings.
Entries: Canada / EU	Number of sanctions list entries in the local database.

Sanctions sources panel

Shows the time of the last list synchronization. **Sync sanctions lists now** downloads the enabled OpenSanctions mirrors immediately (the daily cron does the same automatically).

Last mass check panel

Shows the last mass check time and the number of checks **pending in the queue**. **Check all clients now** starts a mass check:

- with **Queue the mass check** enabled (default) the clients are added to the queue and the cron processes them within minutes;
- with the queue disabled the check runs in your browser in batches with a progress bar.

Database panel

Check database tables verifies all module tables and creates any missing tables or columns (useful after a module update). It is non-destructive — nothing is ever dropped — and displays a per-table report (`created` / `altered` / `unchanged`).
