

Vanity Widget

PUQ Web Hosting module **WHMCS**

[Order now](#) | [Download](#) | [Community](#)

Settings → **Vanity widget** generates a standalone "claim your name" landing page (two files) that you can drop on any marketing domain to sell vanity slots outside the WHMCS portal.

PUQ Web Hosting

The screenshot shows the WHMCS interface for the Vanity widget settings. At the top, there's a navigation bar with 'Home', 'Services', 'Statistics', 'Infrastructure', and 'Logs'. The main content area is titled 'Vanity widget — "claim your name" landing'. It contains several sections: 1. 'Shared API key' with a text input field containing a long alphanumeric string and a 'Regenerate' button. 2. 'Your vanity product' with a dropdown menu set to 'Vanity (#104)'. 3. A code block for configuration with a 'Copy config' button. 4. 'Cart behaviour' with radio buttons for 'Product config page' and 'Skip configuration'.

In short, you: (1) get/regenerate a **shared API key**, (2) pick the **vanity product**, (3) copy the config block into `proxy.php`, (4) choose the **cart behaviour**, then **download** `proxy.php` + `index.html` and upload both to each marketing domain's web root.

The screenshot shows the 'Download the 2 files' section with two buttons: 'Download proxy.php' and 'Download index.html'. Below it, there's a 'How it works' section with a list of four steps and an API endpoint reference.

The browser only ever talks to the widget's own `proxy.php` (which holds the key and caches answers) — the key never reaches the visitor.

“ The full setup, the buyer's flow and the security model are documented in the dedicated **Vanity Mode → The vanity shop widget** page.
