

Vanity Widget

PUQ Web Hosting module **WHMCS**

[Order now](#) | [Download](#) | [Community](#)

Settings → **Vanity widget** generates a standalone "claim your name" landing page (two files) that you can drop on any marketing domain to sell vanity slots outside the WHMCS portal.

PUQ Web Hosting

The screenshot shows the WHMCS Settings page for the 'Vanity widget' module. The page title is 'Vanity widget — "claim your name" landing'. The main content area is divided into several sections:

- 1. Shared API key:** A text input field contains the API key 'd01ee1926883438253a815c6f02fd51518dd43455c25d03b'. A 'Regenerate' button is next to it. Below the field, it says 'Used by proxy.php to authenticate to your WHMCS. Regenerating invalidates all deployed widgets until you update them.'
- 2. Your vanity product:** A dropdown menu is set to 'Vanity (#104)'. Below it, it says 'Pick the vanity product to sell — grouped by product group (only this module's vanity products are listed)'. A note says 'Paste this into the top of proxy.php (identical on every domain):'. A code block contains:

```
const WHMCS_URL = 'https://whmcs-dev.puq.pl';  
const API_KEY = 'd01ee1926883438253a815c6f02fd51518dd43455c25d03b';  
const PRODUCT_ID = 104;
```

A 'Copy config' button is below the code block.
- Cart behaviour:** A section with a shopping cart icon. It says 'What the widget's Get it button does (applies to all deployed widgets — no re-upload needed)'. There are two radio buttons: 'Product config page' (selected) and 'Skip configuration'.

In short, you: (1) get/regenerate a **shared API key**, (2) pick the **vanity product**, (3) copy the config block into `proxy.php`, (4) choose the **cart behaviour**, then **download** `proxy.php` + `index.html` and upload both to each marketing domain's web root.

The screenshot shows the '3. Download the 2 files' section of the WHMCS Settings page. It says 'Upload both to the web root of each domain. proxy.php is downloaded with your WHMCS URL + key (and pid, if set) already filled in.' There are two buttons: 'Download proxy.php' and 'Download index.html'. Below the buttons, it says 'Source also lives in the module package: vanity-shop/ (proxy.php, index.html, README.md)'. The next section is '4. How it works' with a list of instructions:

- The product must be a Vanity product and its group must have *Vanity domains* configured.
- Make sure the product has the `vanity_domain` Configurable Option and the `vanity_name` Custom Field (the product's *Config options* tab creates them).
- Set the pid above, download both files, edit nothing else, upload them to a domain root.
- The landing checks availability via `proxy.php` → your API endpoint, then on *Get it* redirects to `cart.php?a=add&pid=&customfield[1]=name&configoption[1]=domain` with everything pre-filled.

API endpoint (for reference): `https://whmcs-dev.puq.pl/modules/servers/puqWebHosting/vanity_api.php`

The browser only ever talks to the widget's own `proxy.php` (which holds the key and caches answers) — the key never reaches the visitor.

“ The full setup, the buyer's flow and the security model are documented in the dedicated **Vanity Mode → The vanity shop widget** page.
